

August 28, 2017

Crestone Peak Resources will soon begin the task of plugging and abandoning the nearby Vessels Minerals E1 oil and natural gas well site. This location is north of Austin Avenue and west of Mason Street.

Starting this week, we will begin installing sound walls around most of the well site. We will likely begin plug and abandon activity the week of Sept. 10, 2017.

During this activity, a truck mounted service rig will move in and rig up. A crew will pull tubing out of each of the seven wells on this location. We will set permanent plugs in the wellbore and cement each well per Colorado Oil & Gas Conservation Commission (COGCC) regulations. Once set, each wellbore will be cut-off below surface and a metal plate will be welded into place. All surface equipment that supports these wells will be removed. The area around the plugged and abandoned wellsite will be reclaimed per Crestone's agreement with the surface owner. Equipment expected on location during this time includes a truck mounted service rig, crane, various pieces of heavy equipment, water tanks, trucks and worker pickup trucks.

During this activity, neighbors can expect to see an increase in traffic to the location. All access is limited to the designated access road. Crestone traffic will enter to the east of the location off of the corner of Mason Street and Austin Avenue and will avoid driving in front of Aspen Ridge Preparatory School if at all possible. In addition, Crestone will limit traffic to and from the site during drop off and pick up times at the school Monday through Friday, 6:30-8:30 am and 2-4 pm.

All work will be done during the day, Monday through Saturday. This activity should last approximately eight weeks (barring any weather delays). Seeding the location is weather dependent and will likely be done 30-60 days after all the equipment has been removed.

Please contact Crestone at 720-410-8537 or CommunityRelations@CrestonePR.com with any questions.
